Professional Summary

Computational physicist and scientific machine learning researcher working at the intersection of lattice field theory, mathematical physics, and generative AI. My research develops multi-scale theoretical and computational frameworks based on effective field theory, perturbation theory, and asymptotic analysis. More recently, my work has focused on machine learning methods for lattice field theory.

Research impact: 26 peer-reviewed publications, h-index 19, 3000+ citations.

Flagship Research Contributions

- **Precision lattice QCD and Standard Model parameters:** Contributed to high-precision determinations of quark masses, meson decay constants, and hadronic matrix elements through the MILC, Fermilab Lattice, HPQCD, and TUMQCD collaborations. These results are incorporated into global reference averages, including FLAG and the PDG.
- **Effective field theory for multi-scale QFT:** Developed and applied effective field theory frameworks (Symanzik EFT, ChPT, HQET) to systematically connect lattice simulations with continuum QCD observables, enabling controlled multi-scale analyses.
- **MRS scheme:** Developed the minimal renormalon-subtracted (MRS) scheme, providing a systematic treatment of renormalon ambiguities in perturbative QCD without introducing an arbitrary subtraction scale, enabling stable multi-scale analyses and high-precision heavy-quark mass determinations.
- **Diffusion models for lattice gauge theory:** Developed an implicit score-matching framework for Lie groups, enabling generative modeling for $SU(N)$ lattice gauge field configurations.
- **Scientific machine learning infrastructure:** Developed GPU-accelerated software frameworks for diffusion models, normalizing flows, and differentiable scientific computing.

Mathematical & Asymptotic Methods

- **Nonlinear eigenvalue problems:** Introduced analytical and numerical methods for nonlinear eigenvalue problems arising in nonlinear systems with separatrix structure.
- **Hyperasymptotics:** Developed and applied hyperasymptotic and resummation techniques for perturbative expansions in QFT, enabling controlled treatment of divergent series and renormalon ambiguities.

Education

2015 **PhD in Physics**, *Washington University in St. Louis*

Thesis: *Topics in Lattice Gauge Theory and Theoretical Physics*

- Developed EFT-based frameworks and Bayesian inference methods for lattice QCD.
- Performed precision determinations of hadronic observables in lattice QCD.
- Developed a novel definition of eigenvalue problems for nonlinear systems arising in physics.

2009 **MSc in Electrical Engineering**, *University of Tehran*

- Focus: electromagnetic waves and fields, signal processing, statistical analysis.

2006 **BSc in Electrical Engineering**, *University of Tehran*

Professional Experience

- 2021–2026 **Postdoctoral Researcher, ETH Zurich**
- Developed diffusion and score-based generative models on Lie groups for lattice gauge theory.
 - Built differentiable computing frameworks using PyTorch (ODE solvers and linear algebra).
 - Integrated normalizing flow modules into the EU interTwin Digital Twin Engine.
 - Developed distributed training infrastructure for large-scale lattice simulations.
 - Supervised PhD, MSc, BSc, and internship projects in scientific machine learning.
- 2019–2020 **Postdoctoral Researcher, University of Tehran**
- Performed precision determinations of hadronic form factors.
- 2017–2018 **Postdoctoral Researcher, University of Glasgow**
- Computed hadronic form factors and quark condensates.
- 2015–2017 **Postdoctoral Researcher, Technical University of Munich**
- Performed precise determinations of quark masses and decay constants.

Open-Source Scientific ML Software

- `lattice_ml` **Installable Python package for scientific machine learning**
- Diffusion-based generative modeling on Lie groups and gauge theories.
 - Adjoint-based differentiable ODE solvers for scalar and Lie-group-valued systems.
 - Differentiable SVD and eigendecomposition of unitary matrices.
- `normflow` Installable Python package for normalizing flows on Lie groups and lattice gauge theory, including symmetry-preserving transformations and flow-based sampling methods.
- `interTwin` Contributed normalizing-flow-based ML modules to the EU interTwin Digital Twin Engine.

Technical Skills

Machine Learning PyTorch, Diffusion Models, Normalizing Flows, Score Matching, Generative Modeling, Distributed Training.

Programming Python, C++, Cython, Bash.

Scientific Computing NumPy, SciPy, Pandas, Monte Carlo Methods, Bayesian Inference, Statistical Modeling, Differentiable ODE Solvers.

Infrastructure Linux, Git, CUDA, MPI, HPC and Supercomputing Environments (including CSCS).

Mathematics Differential Equations, Linear Algebra, Asymptotic Analysis, Optimization.

Co-supervision and Mentoring

- PhD
- Octavio Vega (2024–2026) — Group-equivariant diffusion models for lattice field theory.
 - Ben Izett (2026) — Fourier acceleration for $SU(N)$ lattice gauge theory.
- MSc
- Lara Turgut (2025–2026) — Gauge-equivariant diffusion models for lattice field theory.
 - Ahmed Chahlaoui (2024–2025) — Autoregressive models for lattice configurations.
 - Antoine Misery (2024) — Continuous-time generative models for lattice fields.
 - Flavia Giehr (2024) — Continuous normalizing flows with adjoint methods.
 - Klemen Kersic (2023) — Rational-quadratic splines for normalizing flows.
 - Lea Segner (2023) — Simulated tempering for topological freezing.
- BSc
- Nicolas Müller (2025) — Path integral formulation of QM and Monte Carlo Simulations.
- Intern
- Elias Nyholm (2023) — CNN architectures in arbitrary dimensions.

Teaching Experience

- ETH Zurich
- **Substitute lecturer & head teaching assistant:** QM I & II (2024).
 - **Proseminar mentoring and supervision:** General Relativity (Spring 2025), Riemann Surfaces in Mathematical Physics (Spring 2023), Systems out of Equilibrium (Fall 2022), Quantum Information (Spring 2022), Theoretical Physics (Fall 2021).
- UT
- **Organizer and lecturer:** Workshop on lattice field theory for students (Fall 2019).
- UG
- **Teaching assistant:** C Programming under Linux (Spring 2018).
- TUM
- **Teaching assistant:** Particle Physics (Spring 2016) and QFT (Fall 2015).
- Wash. U.
- **Teaching assistant:** Statistical Mechanics (Spring 2015), Quantum Mechanics (Fall 2013), Physics I (Fall 2012), Physics II (Spring 2011), Special Relativity (Spring 2011).

Invited Presentations

- ECT* 2026 Bridging machine learning and statistical field theory through generative and diffusion processes, ECT* in Trento, Italy, 7–11 Sep, 2026.
- ECT* 2023 Machine learning for lattice field theory and beyond, ECT* in Trento, Italy, 26–30 Jun, 2023.
- ETH 2022 Efficient simulations on GPU hardware, ETH Zurich, 24–27 Oct, 2022.
- $g - 2$ 2022 Fifth Plenary Workshop of the Muon $g - 2$ Theory Initiative, Edinburgh, 5–9 Sep, 2022.
- CKM 2018 10th International Workshop on the CKM Unitarity Triangle, Heidelberg, 17–21 Sep, 2018.
- Latt. 2018 36th International Symposium on Lattice Field Theory, East Lansing, 22–28 Jul, 2018.

Professional Service

- Refereeing Referee for Physical Review D and Physical Review Letters (13+ reviews since 2016).
- Organization **Co-organizer of international and local workshops:**
- ZPW 2026 — Machine Learning Techniques for Particle Physics.
 - QCD 2025 — Symposium on QCD Factorization.
 - ML Lattice 2025 — Machine learning approaches in Lattice QCD.
 - UT 2019 — Lattice QCD workshop.
 - TUM 2017 — EFT and Lattice Field Theory Summer School.

Selected Publications

- J. Komijani, M. Marinkovic and L. Turgut, “Diffusion models for $SU(N)$ gauge theories,” [[arXiv:2605.06134](#)].
